

Make sure your AED is performance tested annually and ready to go when/if you need it.

EIS provides a live shock testing service onsite by trained professionals using industry leading AED/Defibrillator Analysis equipment and testing procedures.

Even though AEDs require very little maintenance they are medical devices and as such they come under AS/NZS3551:2012 (Australian/NZ standards). It's essential they are checked annually to performance and verification standards.

You have taken the best step by investing in an AED which could be a life saving decision. We hope you never have to use it but if you do we can give you peace of mind that it will do its job.

Our annual inspection provides verification of the output of the AED, running through a range of physical, functional, and electrical tests to verify it can perform safely as intended by the manufacturer. The organisation with an AED onsite must ensure that safety and performance of the medical equipment is maintained by annual assessment, testing, and maintenance in accordance with AS/NZS3551:2012.

EIS offers clients an annual AED testing service to ensure your AED operates and is compliant with today's standards.
